PipeFeeder

Innovated by Hanskamp AgroTech

In Parlour Feeding

Hanskamp AgroTech

Innovation for dairy farming

Why the PipeFeeder?

Better milking

Cows fed during milking are happy to come into the milking stall and let down their milk better. The PipeFeeder makes a genuine success of concentrate supply to the milking stall by providing small portions of feed with great accuracy throughout the entire milking period. The benefit to you? Quieter, quicker milking with considerably less concentrate fed.

Less concentrate and a calmer atmosphere in the milking stall

Practical design

The PipeFeeder excels in durability, simplicity and precision. This concentrate dosing unit was designed by technicians from the farming sector, experts who know that dairy farmers want to save on feed costs by dispensing precisely the right amount.

Oxytocin

Feeding the cow during milking ensures peak concentration of oxytocin hormone, which boosts milk let down. With the PipeFeeder you are responding perfectly

Source: 'Effect of feeding before, during and after milking on milk production and the hormones oxytocin, prolactin, gastrin and somatostatin.' Birgitta Johansson et al, Swedish University of Agricultural Sciences, Uppsala 1998.

A summary of the benefits

- Robust and compact Dutch design
- Dose up to 25 grams accurately
- Silent
- Quick and low cost installation
- Can be connected to any feeding system
- Shorter milking time

to this knowledge as the dosing unit continuously supplies small amounts of concentrate. The cow keeps on eating and lots of oxytocin is produced so milking time is cut and the capacity of your milking installation increased.

Peace and quiet in the stall at all times

The great advantage of the PipeFeeder over other dosing units is that it is virtually noise free, because the motor is built in and the concentrate falls into the feeder from a very low height.

Modern technology

The stock of feed is located in the robust stainless steel pipe of the dosing unit along with an ingenious dosing system that accurately releases quantities as low as 25 grams. This means your cows get exactly the amount of concentrate they need to let down their milk. More and more dairy farmers are recognising the urgent need to respond to rising concentrate costs and precise feeding in the milking stall meets this need.

The dosing unit can be fitted in any type of milking stall and suits any type of feeding or management system. The PipeFeeder can also be fitted to a feeding station in a dairy unit with cow cubicles. With several PipeFeeders next to one another you can even supply several types of chunks into the feed box. Of course, the dosing unit can also be equipped with the popular DosPrint from Hanskamp AgroTech.
